## Adjustable Rear Camber Arm

**Q1: There is a bracket included in my control arm kit, what is its purpose?**

**A1:** Some vehicles use a ride height sensor that connects to the factory control arm. The bracket should be installed on the new adjustable control arm so the ride height sensor link is in the same position as it was on the stock arm.

**Q2: My control arm does not have a ride height sensor bracket and I need one. What can I do?**

**A2:** Please call Specialty Products at 1-800-525-6505 and ask for part number 70009003.

**Q3: After installation, it looks like the height sensor bracket may hit the arm or sensor.**

**A3:** Early brackets had less clearance. If it looks tight, the bracket should be bent in more so that there is minimal clearance between the bracket and the hex adjuster. This will straighten the sensor arm out, and provide improved clearance.
