Camber/Toe Kit

Q1: How does this kit give more change with the same sized cam and why do I have to “elongate” the slot?

A1: The SPC cam contains more offset for the pivot bolt than the OE cam which provides additional range for adjustment. Elongation of the OE slots is required to use the added capability of the SPC product.

Q2: Why does the first step of the toe bolt instructions tell me to lift the vehicle under the spring seat?

A2: In order to elongate the toe slot you must get the load-bearing, toe link out of the way. Supporting the vehicle under the spring seat of the control arm will enable you to move it out of the way without removing the spring.
