Additional Camber Change

Q1: I need more change than the 81310 rear camber kit provides by putting one bolt on the arm to knuckle joint. Can I also replace the inner bolt to get more change?

A1: Yes, if you need more change than replacing the outer bolt gives, you can also change the inner bolt. You will need to point the large tabs inboard for additional negative change and point the large tabs outboard for additional positive change. (Yes, this is reverse of the orientation of the washers called out in the instruction sheet, which had you placing the hardware on the outer end of the control arm.)

Q2: Do you have another product that offers more change and easier adjustability?

A2: Yes, depending on your application, there is likely an adjustable control arm available. The adjustable control arm is more expensive, but is more intuitive to use and more easily adjustable for a larger range. Check out SPC's applications on-line to see which R&R control arm will work for your application.
